

# Modelling and Observation of Exhaust Gas Concentrations for Diesel Engine Control (Springer Theses)

The book presents a complete new methodology for the on-board measurements and modeling of gas concentrations in turbocharged diesel engines. It provides the readers with a comprehensive review of the state-of-art in NO<sub>x</sub> and lambda estimation and describes new important achievements accomplished by the author. These include: the online characterization of lambda and NO<sub>x</sub> sensors; the development of control-oriented models of lambda and NO<sub>x</sub> emissions; the design of computationally efficient updating algorithms; and, finally, the application and evaluation of the methods on-board. Because of its technically oriented approach and innovative findings on both control-oriented algorithms and virtual sensing and observation, this book offers a practice-oriented guide for students, researchers and professionals working in the field of control and information engineering.
